

# PRODUCT DATA SHEET

## N-Tetracosenoyl-(*cis*-15)-sulfatide

**Catalog No:** 1931

**Common Name:** N-Nervonyl-sulfatide; N-C24:1-Sulfatide; N-Tetracosenoyl-sphingosyl-*beta*-D-galactoside-3-sulfate

**Source:** semisynthetic, bovine

**Solubility:** chloroform/methanol (5:1); DMSO

**CAS No:** 151057-28-2

**Molecular Formula:** C<sub>48</sub>H<sub>91</sub>NO<sub>11</sub>S

**Molecular Weight:** 890

**Storage:** -20°C

**Purity:** TLC > 98%; identity confirmed by MS

**TLC System:** chloroform/methanol/DI water (60:30:4 by vol.)

**Appearance:** solid

### Application Notes:

Sulfatide is a type of sulfolipid that is found primarily in the central nervous system and is a myelin-specific sphingolipid. A deficiency of sulfatide in white and gray matter has been associated with Alzheimer's disease and other types of dementia. Apolipoprotein E plays an important regulating role in the metabolism of sulfatides.<sup>1</sup> A production of anti-sulfatide antibodies in the cerebrospinal fluid, leading to a deficiency in sulfatides, may be a cause of degeneration of the myelin sheath, leading to multiple sclerosis.<sup>2</sup> Metachromatic leukodystrophy is an inherited disorder characterized by a deficiency of the lysosomal enzyme arylsulfatase A and the subsequent accumulation of sulfatide in neural and visceral tissues.<sup>3</sup> An immunomodulatory role for sulfatides has been suggested in the pathogenesis of tuberculosis. Sulfatides decrease the in vitro production of proinflammatory cytokines.

Tetracosenoyl sulfatide has been found to be a major immunodominant specie in myelin. This has important implications for the design of therapeutics that target T cells reactive for myelin glycolipids in autoimmune diseases of the central nervous system.<sup>4</sup> Tetracosenoyl sulfatide has also been demonstrated to reverse ongoing chronic and relapsing experimental autoimmune encephalomyelitis in mice.<sup>5</sup>
